

FENCE

ABSTRACT

A fence for guiding a work surface past a saw blade supported by a table having a support
5 tube running substantially perpendicular to the saw blade. The fence includes a rip fence
having a plurality of studs disposed on opposing sides thereof. A pair of fence faces are
positioned on opposing sides of the rip fence and have a plurality of slots for removably
engaging the studs thereby securing the face fences to the rip fence. A rip fence head is
affixed beneath the rip fence. A lockdown clasps the support tube with the rip fence head
10 for securing the fence to the tablesaw. The lockdown includes an adjustment mechanism
for stabilizing the fence to the support tube independently of the lockdown. The
adjustment mechanism is adjustable relative to the lockdown so that the position of the
fence on the support tube can be accurately adjusted by moving the fence relative to the
lockdown mechanism.
